Alphanumeric and non-alphanumeric rapid automatized naming in children with reading
and/or spelling difficulties and mathematical difficulties.

Summary: Although poor Rapid Automatized Naming (RAN) is a risk factor for reading and/or spelling
difficulties (RSD) as well as for mathematical difficulties (MD), many questions surround this relationship.
The main objective of the present study was to obtain insight in the relationship between alphanumeric vs.
non-alphanumeric RAN and reading/spelling and mathematics in groups of 7-to-10-year-old children with
RSD, MD, both RSD+MD, and in typically developing (TD) children. Analyses of variance between the
groups showed that the RSD and comorbid (RSD+MD) groups were impaired on both alphanumeric and
non-alphanumeric RAN, whereas the MD group was impaired only on non-alphanumeric RAN. Furthermore,
non-alphanumeric RAN correlated with all measures except spelling, whereas alphanumeric RAN correlated
with the reading and spelling measures only. These findings point towards different/additional cognitive
processes needed in non-alphanumeric RAN compared to alphanumeric RAN, which affects the relationship
with literacy and math.

Classification: F22 C52 C42 D72
Keywords: rapid automatized naming (RAN); non-alphanumeric RAN; alphanumeric RAN; reading/spelling
difficulties; mathematical difficulties
