Determining the weight of the 'Terror Bird'.

UMAP Modul. 2004-2005, 129-164 (2006).

The terror birds were giant, flightless, predatory birds. Recently in Florida, fossils have been discovered of one terror bird, *Titanis walleri*, which successfully made the long walk from the grasslands of South America to Florida by way of the Gulf Coastal Plain. The authors develop models to estimate size, weight and speed of these birds.
