Exploration of a Geometric Model of Data Fusion.

Proc. ASIS Annu. Meet. 39, 124-29 (2002).

Explores aspects of data fusion (DF) for information retrieval (IR) using a set of data from the Fifth International Conference on Text Retrieval (TREC5). Derives an equation for effective DF based on a geometric model and shows that the performance of a pair of IR schemes may be approximated by a quadratic polynomial. (ERIC)
