Sequential-Simultaneous Profile Analysis of Korean Children's Performance on the Kaufman Assessment Battery for Children (K-ABC).

Res. Sch. 1, No. 2, 29-35 (1994).

Korean children (n=440) aged 2.5 to 12.5 years were tested with the Korean version of the Kaufman Assessment Battery for Children (K-ABC) (A. Kaufman and N. Kaufman, 1983) to see if these children demonstrated a profile similar to that of Japanese children. Korean children scored higher on the Sequential Scale than Japanese children, and had a strong ability for number recall, relative to Americans. (ERIC)
