Brown, Margaret

Progression in Measuring.

Res. Pap. Educ. 10, No. 2, 143-70 (1995).

Describes a study by British researchers that attempted to describe progression in learning in terms of a common framework for all students. Elementary school students completed periodic interviews while being taught measurement skills. Results found a wide spread of attainment in measurement in each age range but less clear progression between age groups. (ERIC)
