Boieri, Paolo; Dané, Cristiano
Dynamic geometry and integral calculus. (Geometria dinamica e integrale.)

Summary: In this paper the authors describe an approach to integral: they start from the relationship between integral and the idea of area in elementary geometry and they end with the fundamental theorem of calculus and its proof. After a discussion of basic methodological assumptions, several experiences involving dynamical geometry software are presented and carefully described.

Classification: 150 U70 R20
Keywords: area; integral calculus; dynamic geometry software
